The analysis of the world practice of small business and private entrepreneurship development shows that today 60-70 percent of the GDP of most countries is contributed by this sector. Also, by developing small business and private entrepreneurship, it is important to strengthen the competitive environment in the national economy of countries, to stimulate demand by expanding the consumer sector, to saturate the domestic consumer market with goods and services, to increase the volume of the country's exports, and to increase the income of the state budget.

For this reason, most countries give priority to the implementation of reforms aimed at developing small business and private entrepreneurship, increasing its investment efficiency, and moving this sector to the path of innovative development.[3] In the years of independence, the share of small business and private entrepreneurship in various sectors and sectors of the national economy of our country has increased, becoming one of the important factors of ensuring economic growth and social stability.

In particular, in 1991, the share of small business entities in the GDP was 1.5 percent, in 2000, this indicator reached 31 percent, and in 2016, it reached almost 65.0 percent. In 2016-2020, the number of small business entities operating in the sectors of the national economy of our country increased by almost 2.0 times, from 210.6 thousand units to 411.2 thousand units, respectively. During the analyzed period, the share of small business entities in the structure of general enterprises and organizations increased by 86.5 percent. Also, in 2017-2020, more than 288 thousand new enterprises were established in our country, of which 94.9 percent or 273.2 thousand correspond to the contribution of small business enterprises.[4]

It is difficult to imagine the basis of the economic and social reforms implemented in our republic without entrepreneurship, factoring and business factors. Wide development of free, competition-based market relations is reflected in people's lives, their lifestyle, spiritual and life skills. Currently, the citizens of our republic have enough information about the rich practical experience of countries such as developed Europe, USA, and Japan.

Therefore, a number of laws, decrees and decisions dedicated to the development of entrepreneurship, its support by the state, initiation and stimulation of private entrepreneurship were adopted. All this requires raising a mature generation, which is considered the foundation of Uzbekistan's development.

President Sh.Mirziyoev's "Education of a spiritually well-developed person, raising education and knowledge, raising a new generation that will realize the idea of national renaissance remains one of the most important tasks of our state" we have always had a good idea that it is possible to achieve the goals of development" [2].

The education of a perfect person begins first of all with the family. There is a saying in our people, "A bird does what it sees in its nest." We can say that the improvement of the well-being of the family economy in the conditions of market relations is directly based on the activity of family members, especially parents, the formation of entrepreneurial skills in young people, the ability to use property, the ability to spend expenses appropriately, and the ability to engage in household and other income-generating activities.

Organization and development of any activity requires a high level of knowledge, skills and competence. Parents should systematize their children's knowledge and guide them with the help of practical action plans and intelligence to get the final results. Acquiring knowledge is not a complicated process, but it is necessary to know how to direct the acquired knowledge. In order to acquire modern knowledge and skills, it is necessary to pay attention to the following:

- Constant training of children about life experiences and information of fathers and mothers;
- Experience and knowledge obtained as a result of constant communication with knowledgeable and experienced people;
- Special knowledge and vocational training centers;
- Higher and secondary special educational institutions;
- Public information and information resource centers and timely press.

As the children grow up in the family, entrepreneurship is formed and developed as a result of getting them interested in the types of work, regardless of any type of work they are interested in. That a person can reach high heights as a result of constant efforts to acquire high-quality knowledge and skills. And on the contrary, it is an important task for parents not to get tired of explaining to young people that an uneducated and unskilled person faces difficulties in life and is doomed to live without enjoying life in general.

Based on the above, the emergence of entrepreneurs in the family farms of our country is based on the opening of a number of new jobs, the rapid improvement of the well-being of families, and the implementation of these processes is based on the fact that our country will get rid of family farms and their members, and the state will become a benefactor.
