A B S T R A C T

This article examines the significance of the integrative approach within the electronic learning environment for enhancing students' professional preparation and independent learning competencies. The effective combination of interdisciplinary integration, interactive methods, and personalized learning resources is analyzed as a key factor in developing students' professional knowledge, practical skills, and reflective activity. The study also provides practical recommendations aimed at improving e-learning and strengthening learners' professional potential.

Introduction

In the modern educational process, the role and significance of the electronic learning environment are steadily increasing, providing learners with the opportunity to acquire knowledge in an independent, interactive, and personalized manner. Digital resources based on information and communication technologies are emerging as effective tools for optimizing the learning process of students, enhancing their level of professional training, and developing their practical skills.

The integrative approach serves to comprehensively develop students' professional competencies by harmonizing various disciplines, technologies, and types of practical activities. When such an approach is integrated with the electronic learning environment, students develop the ability to apply theoretical knowledge to real professional tasks, solve problematic situations, make independent decisions, and conduct reflective analysis. Therefore, methodologies based on an integrative approach occupy an important place in guiding students toward professional preparation within the electronic learning environment. This approach not only increases the effectiveness of the educational process but also ensures the development of students' independent learning culture, competencies in working with information, and a high level of readiness for professional activity. As a result, the digital opportunities of the pedagogical process expand, and students' professional potential develops consistently.

From a psychological perspective, this approach:

- Activates students' abilities for independent thinking, analysis, and creativity;
- Strengthens their cognitive processes through the integration of theoretical knowledge with practical activities;
- Fosters internal motivation, professional interest, and goal-oriented activity.

From a pedagogical standpoint, the main advantage of the integrative approach lies in the fact that it systematically strengthens students' professional preparation by harmonizing interdisciplinary knowledge with practical skills. Such an approach encourages students to actively participate in the learning process not only at the stage of receiving information, but also at the stages of processing, applying, analyzing, and evaluating it.

The electronic learning environment creates the following didactic opportunities:

- Deeper understanding of topics through interactive learning materials (video, animation, infographics, simulations);
- Determining the level of knowledge, promoting self-assessment, and strengthening motivation for independent learning through online tests and adaptive assessment systems;
- Developing professional skills through virtual laboratories and distance practical training;
- Enhancing communicative competencies and increasing experience in solving collaborative problems through forums, discussion platforms, and collaborative environments.

The integrated application of these opportunities significantly increases students':

- Culture of independent work;
- Initiative and creative thinking;
- Digital literacy is necessary for modern professional activity:
- As well as their level of professional preparedness.

The integration of the electronic learning environment and the integrative approach creates a powerful pedagogical mechanism that contributes to the development of students' practical, communicative, and reflective competencies along with their theoretical knowledge.

In the pedagogical process, developing students' professional preparation and independent working skills requires a complex and multifaceted strategy. From this perspective, the first step in effectively guiding students' activities is to define clear objectives and tasks for each lesson. This not only helps organize the learning process on a structural basis but also creates opportunities for the systematic development of students' professional competencies.

The second important aspect is the selection and integration of electronic resources. Based on the integrative approach, electronic resources harmonize knowledge obtained from different disciplines, strengthen students' practical skills, and stimulate the process of independent learning. At the same time, when electronic resources are adapted to students' individual interests, their motivation for learning activities increases significantly.

The third main direction is the application of interactive and reflective methods. Interactive methods, including virtual laboratories, simulations, and project-based activities, ensure the active involvement of students in practical activities. Reflective methods, such as electronic portfolios, self-assessment, and analytical mechanisms, enable students to systematically analyze their own activities and identify directions for self-development.

The fourth aspect is the effective organization of assessment and monitoring systems. Automated and adaptive assessment systems on electronic platforms continuously monitor students' knowledge and skills, analyze the effectiveness of lessons, and help form individual development trajectories. This not only helps manage the learning process effectively but also enables pedagogical decisions to be made on the basis of data.

It should be emphasized that when the above methods are applied in a coordinated manner, students' professional preparation increases significantly, a culture of independent work is formed, and they develop as specialists prepared for their future professional activities.

In improving the effectiveness of pedagogical activity, the integrative approach is recognized as the main strategy for developing students' professional preparation and independent working skills. From this perspective, the stages of planning lessons based on the integrative approach should be systematic and consistent. These stages can be explained as follows:

1. Analysis stage: At this stage, the teacher conducts a thorough analysis of students' individual learning needs, their existing level of knowledge, and practical skills. In addition, by identifying interdisciplinary connections and integration opportunities, ways of effectively harmonizing the theoretical and practical components of the lesson are determined. The important aspect of this stage is that it helps identify students' capabilities in the learning process and optimize the subsequent stages of the lesson.

2. Planning stage: The planning stage begins with clearly defining the objectives and tasks of the lesson. As the author, I would like to emphasize that each objective should be directed toward developing students' professional competencies and forming their independent working skills. At the same time, selecting electronic learning resources and interactive elements is of great importance. These resources enable the integration of theoretical and practical components of the lesson and make the learning process more engaging and effective.

3. Organization of the lesson: At this stage, selected electronic resources, online classes, group activities, seminars, and virtual laboratories are integrated into a single system. According to the author's perspective, incorporating reflective and self-assessment elements into the lesson ensures students' active participation and stimulates the mechanism of self-development. In this way, students gain the opportunity to apply their knowledge in practice, analyze it, and evaluate the results.

4. Assessment and analysis: The final stage of the lesson involves evaluating students' results and analyzing the effectiveness of the lesson. With the help of automated and adaptive assessment systems, students' knowledge and skills are continuously monitored, and opportunities for self-assessment are provided. At the same time, the teacher identifies the strengths and weaknesses of the lesson and develops methodological recommendations aimed at improving its quality. This process helps determine students' individual development trajectories and optimize the learning process.

Directing students toward professional preparation and independent learning in an electronic learning environment through an integrative approach is considered one of the most effective strategies of the modern pedagogical process. This approach enables students to harmonize theoretical knowledge with practical skills, while also developing their abilities for independent thinking, analysis, and creative activity. Electronic learning platforms provide opportunities to organize lessons in an individual and flexible manner, ensuring students' active engagement in the learning process.

In addition, the integrative approach strengthens students' abilities of self-assessment and reflection through the application of interactive and reflective methods. This significantly improves their professional motivation, helps them gain practical experience, and enhances their level of readiness for future professional activity.

As the author, it can be emphasized that the effective application of the integrative approach within the electronic learning environment not only makes the learning process more effective and engaging but also enables the teacher to monitor students' activities, determine their individual development trajectories, and continuously improve the learning process. Based on this conclusion, the following practical recommendations can be proposed:

Systematic application of integrative methods in lesson planning: Identifying interdisciplinary connections in every lecture and practical session and integrating electronic resources with interactive elements enhances students' professional preparation.

Encouraging reflective and independent activity: It is recommended to strengthen students' self-development and independent working skills through the use of electronic portfolios, self-assessment, and analytical systems.

Determining and assessing individual development trajectories: With the help of adaptive assessment systems, students' knowledge and skills should be regularly analyzed, and pedagogical decisions should be made on the basis of data. This contributes to the maximum development of students' professional competencies.
